

Do you have Diabetes and Numbness? Have You had a Foot Ulcer?

This Clinic is taking part in **important research** on a better treatment to prevent recurring diabetic foot ulcers and such serious complications as infections and amputations. Early results suggest these complications might be reduced by simple surgery to relieve pressure around nerves.

The study will evaluate how many diabetic foot ulcers return for patients with the usual care compared to those patients having a simple nerve surgery in addition to usual care.

To learn more about this study and whether you might qualify to participate, speak to the receptionist, leave a message at 307 752-9875, or go to the Extremity Nerve Research Foundation page at aens.us
